

8. Diameter of Binary Tree (Leetcode-543)

Ex 1

Explanation what is Diameter?

$$\begin{aligned}
 \text{Diameter} &= \text{LH Edges} + \text{RH Edges} \\
 &= 2 + 1 \\
 &= 3
 \end{aligned}$$

Ex 1

④ $Dia = 2 + 1 = 3$
 $LH = 2$ Root $RH = 1$ *option 3*

② $Dia = 1 + 1 = 2$
 $LH = 1$ $RH = 1$

$Dia = 0 + 0 = 0$
 $LH = 0$ $RH = 0$ ⑤

① $Dia = 0 + 0 = 0$
 $LH = 0$ $RH = 0$

$Dia = 0 + 0 = 0$
 $LH = 0$ $RH = 0$ ③

option 1

BRUTE FORCE APPROACH

1st option =

2nd option =

3rd option =

This is a longest path

Output = 3

Diameter = max
 (2, 0, 3)

\Rightarrow 3
Ans

```

//  BRUTE FORCE APPROACH (Overhead of the recursive call)
class Solution {
public:
    int height(TreeNode* root){
        if(root == NULL) return 0;

        int LH = height(root->left);
        int RH = height(root->right);
        int finalHeight = max(LH, RH) + 1;
        return finalHeight;
    }

    int diameterOfBinaryTree(TreeNode* root) {
        //base case
        if(root == NULL) {
            return 0;
        }
        int option1 = diameterOfBinaryTree(root->left);
        int option2 = diameterOfBinaryTree(root->right);
        int option3 = height(root->left) + height(root->right);
        int diameter = max(option1, max(option2, option3));
        return diameter;
    }
};

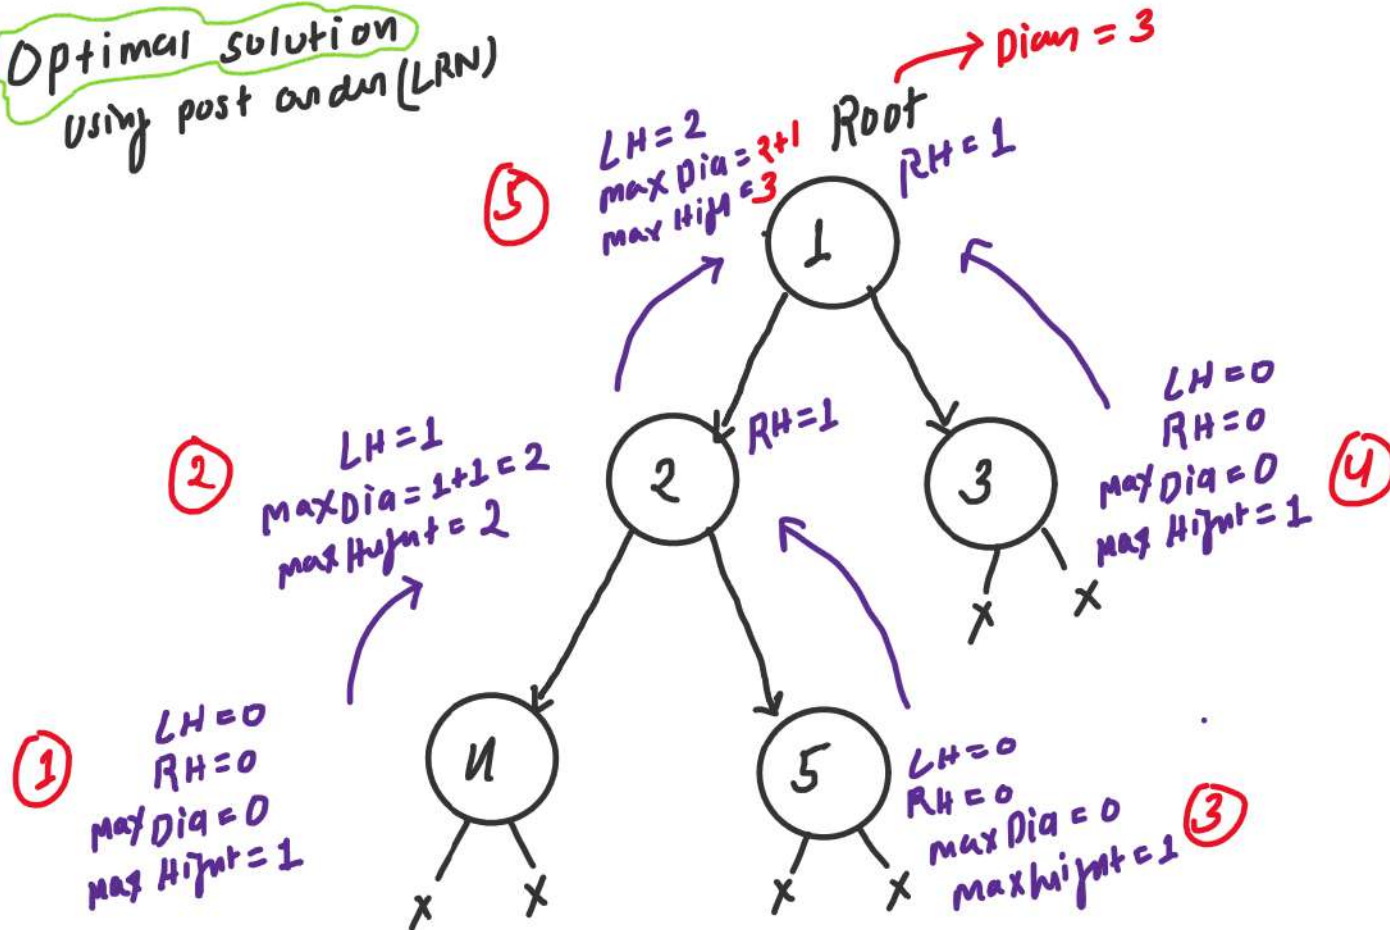

```

Time complexity: $O(N^2)$, Where N number of nodes

Why $O(N^2)$? --> Height function is called by right and left subtree separately for each one node.

Space complexity: $O(N)$ due to the recursive call stack

Optimal solution
using post order (LRN)

$$Diameter = \max(Dia, (LH + RH))$$

$$Height = \max(LH, RH) + 1$$

Output

Diameter = 3

post order
 $\hookrightarrow 4 \rightarrow 5 \rightarrow 3 \rightarrow 1$

```

// ✅ OPTIMAL APPROACH (No overhead of the recursive call)
class Solution {
public:
    int height(TreeNode* root, int &diameter){
        if(root == NULL) return 0;

        int LH = height(root->left, diameter);
        int RH = height(root->right, diameter);
        int maxHeight = max(LH, RH) + 1;
        // Update diameter with longest path of tree
        diameter = max(diameter, (LH+RH));
        return maxHeight;
    }

    int diameterOfBinaryTree(TreeNode* root) {
        //base case
        if(root == NULL) {
            return 0;
        }
        int diameter = 0;
        height(root, diameter);
        return diameter;
    }
};

```

Time complexity: $O(N)$, Where N number of nodes

Why $O(N)$? --> Height function is not called by right and left subtree separately for each one node.

Space complexity: $O(H)$, where H is the height of the binary tree
